Abstract

A new species of Bulbophyllum (Orchidaceae), named as B. sondangii discovered in Da Lat Plateau (Da Lat Town area, Lam Dong Province of southern Vietnam) is described and illustrated. The new species is similar to B. andersonii and B. trongsaense, but can be distinguished by a short seta at the apex of median sepal and petals; almost entire margin of petals except the fimbriate apex; lip with auricles at base; and stelidia apiculate at apex. The paper presents the taxonomical description, data on distribution, ecology, phenology and conservation status, as well as notes and the comparison of the newly described plant with morphologically similar species.

Etymology

The species is named after Dr. Dang Van Son (Curator of the VNM Herbarium, Institute of Tropical Biology, Vietnam), Truong Ba Vuong’s PhD advisor, for his immense knowledge and contribution to plant taxonomy.
